			ART UNIT 2622	PAPER NUMBER
			NOTIFICATION DATE 06/25/2008	DELIVERY MODE ELECTRONIC

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Notice of the Office communication was sent electronically on above-indicated "Notification Date" to the following e-mail address(es):

creganoa@addmg.com

Office Action Summary	Application No. 10/820,464	Applicant(s) STORM ET AL.	
	Examiner Carramah J. Quiett	Art Unit 2622	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 19 May 2008.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 14-23, 25-32 and 34-36 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 14-23, 25-32 and 34-36 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 08 April 2004 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☒ None of:
1. ☒ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 05/19/2008 has been entered.

Response to Amendment

2. The amendment(s), filed on 05/19/2008, have been entered and made of record. Claims 14-16, 21-23, 25-26, and 31-32 are pending.

Response to Arguments

3. Applicant's arguments with respect to claims 14-16, 21-23, 25-26, and 31-32 have been considered but are moot in view of the new ground(s) of rejection.

Drawings

4. The drawings are objected to as failing to comply with 37 CFR 1.84(p)(5) because they include the following reference character(s) not mentioned in the description: Figures 2/3, ref. M6. Corrected drawing sheets in compliance with 37 CFR 1.121(d), or amendment to the specification to add the reference character(s) in the description in compliance with 37 CFR 1.121(b) are required in reply to the Office action to avoid abandonment of the application. Any amended replacement drawing sheet should include all of the figures appearing on the immediate prior version of the sheet, even if only one figure is being amended. Each drawing sheet

Art Unit: 2622

submitted after the filing date of an application must be labeled in the top margin as either “Replacement Sheet” or “New Sheet” pursuant to 37 CFR 1.121(d). If the changes are not accepted by the examiner, the applicant will be notified and informed of any required corrective action in the next Office action. The objection to the drawings will not be held in abeyance.

Claim Rejections - 35 USC § 102

5. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

6. **Claims 14-16, 21-23, 25-26, and 31-32** are rejected under 35 U.S.C. 102(e) as being anticipated by Morris et al. (U.S. Pat. #6,697,112).

For **claim 14**, Morris discloses an image sensor (fig. 3, ref. 140), comprising:

an array (119) of pixels, each pixel (fig. 4) comprising

a photodiode (152, col. 4, lines 3-29),

a first output circuit (figs. 3, 5, 6, 7, 8) for deriving a linear output signal by applying a reset signal to said photodiode and reading a voltage on said photodiode after an integration time (col. 4, line 55 – col. 5, line 25; col. 6, lines 32-51), and

a second output circuit (figs. 3, 9, 10, 11, 12) for deriving a logarithmic output signal by reading a near instantaneous illumination-dependent voltage on said photodiode that is a logarithmic function of the illumination (col. 5, lines 34-55), and

said first and second output circuits sequentially providing the linear and logarithmic output signals (col. 6, lines 8-51);
an output selection circuit (fig. 3, ref. 127) for selecting between the linear output signal and the logarithmic output signal as an output signal (col. 6, lines 8-51).

For **claim 15**, Morris discloses the image sensor according to claim 14, wherein said first output circuit comprises:

a reset switch (fig. 3, refs. 124/129) for applying a reset voltage to said photodiode (col. 4, lines 3-29), said reset switch comprising a reset transistor (fig. 4, ref. 150) including a conducting terminal connected to said photodiode (col. 6, lines 32-51); and

a readout switch (fig. 3, refs. 124/129) for turning on the conducting terminal of said reset transistor after expiration of the integration time (col. 4, line 55 – col. 5, line 25; col. 6, lines 8-51).

For **claim 16**, Morris discloses the image sensor according to claim 14, wherein said second output circuit comprises:

an amplifier (fig. 4, ref. 156/160; col. 4, lines 3-54); and
a log select switch (fig. 4, refs. 156/160) for connecting said amplifier to said photodiode (col. 4, lines 3-54; col. 5, line 35 – col. 6, line 51).

For **claim 21**, Morris discloses an image sensor (fig. 3, ref. 140) comprising:

an array (119) of pixels (118), each pixel (fig. 4) comprising
a photodiode (152, col. 4, lines 3-29),

a first output circuit (figs. 3, 5, 6, 7, 8) connected to said photodiode for generating an output signal to be a linear output signal (col. 4, line 55 – col. 5, line 25; col. 6, lines 32-51), and

a second output circuit (figs. 3, 9, 10, 11, 12) connected to said photodiode for generating the output signal to be a logarithmic output signal by reading a near instantaneous illumination-dependent voltage on said photodiode that is a logarithmic function of the illumination (col. 5, lines 34-55),

said first and second output circuits sequentially providing the linear and logarithmic output signals (col. 6, lines 8-51); and

an output selection circuit (fig. 3, ref. 127) for selecting between the linear output signal and the logarithmic output signal as an output signal (col. 6, lines 8-51).

For **claim 22**, Morris discloses the image sensor according to claim 21, wherein the linear output signal is selected if the pixel has not saturated during generation of the linear output signal, otherwise, the logarithmic output signal is selected (col. 3, lines 30-46).

For **claim 23**, Morris discloses the image sensor according to claim 21, wherein said first output circuit derives the linear output signal by applying a reset signal to said photodiode and reading a voltage on said photodiode after an integration time (col. 6, lines 32-51).

Claims 25-26 are claims corresponding to the claims 15-16, respectively. Therefore, claims 25-26 are analyzed and rejected as previously discussed with respect to claims 15-16, respectively.

For **claim 31**, Morris teaches a method for operating an image sensor comprising an array of pixels, each pixel comprising a photodiode (col. 4, lines 3-29), the method comprising:

deriving a linear output signal from each pixel (col. 4, line 55 – col. 5, line 25; col. 6, lines 32-51);

deriving a logarithmic output signal from each pixel with the linear and logarithmic output signals (col. 5, lines 34-55); and

sequentially providing the linear and logarithmic output signals

selecting between the linear output and the logarithmic output signal as an output signal (col. 6, lines 8-51).

For **claim 32**, Morris teaches the method according to claim 31, wherein deriving the linear output signal from each pixel comprises:

applying a reset voltage to the photodiode (col. 4, line 55 – col. 5, line 25; col. 6, lines 8-51);

allowing for a predetermined integration time (col. 4, line 55 – col. 5, line 25); and

reading an output voltage on the photodiode (col. 4, line 55 – col. 5, line 25; col. 6, lines 8-51).

Claim Rejections - 35 USC § 103

7. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.

8. **Claims 17 and 27** are rejected under 35 U.S.C. 103(a) as being unpatentable over Morris et al. (U.S. Pat. 6,697,112) in view of Luo et al. (U.S. Pat. 7,071,982).

For **claim 17**, Morris discloses the image sensor according to claim 16, wherein said amplifier is connected to the conducting terminal of said reset transistor. However, Morris does

not expressly disclose wherein said amplifier comprises a differential amplifier having an inverting input connected to the conducting terminal of said reset transistor, and a non-inverting input connected to a reference voltage.

In a similar field of endeavor, Luo discloses the image sensor (fig. 2), wherein said amplifier comprises a differential amplifier (36) having an inverting input connected to the conducting terminal of said reset transistor (V_{PH}), and a non-inverting input connected to a reference voltage (V_{REF}). Please read Luo, col. 5, lines 25-46. In light of the teaching of Luo, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the amplifier of Morris with a differential amplifier as claimed in claim 17 in order to improve the image capture efficiency thereby providing an image with increased wide dynamic range as well as improving power consumption (Luo, col. 1, line 63 – col. 2, line 39).

Claim 27 is a claim corresponding to claim 17. Therefore, claim 27 is analyzed and rejected as previously discussed with respect to claim 17.

9. **Claims 18-19, 28-29, and 34-35** are rejected under 35 U.S.C. 103(a) as being unpatentable over Morris et al. (U.S. Pat. 6,697,112) in view of Kusaka et al. (US 2005/0052557).

For **claim 18**, Morris discloses the image sensor according to claim 14. However, Morris does not expressly teach further comprising a calibration circuit for calibrating each pixel before deriving the logarithmic output signal.

In a similar field of endeavor, Kusaka discloses an image sensor (fig. 1, ref. 1) comprising a calibration circuit (fig. 1, refs. 4-6) for calibrating each pixel before deriving the

logarithmic output signal (p. 3-4, paragraphs 54-71). Also, please see Kusaka, figs. 2-3. In light of the teaching of Kusaka, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the image sensor of Morris with a calibration circuit as claimed in claim 18 in order to automatically achieve an improved wide brightness range as well as an improved a narrow brightness range (Kusaka, p. 1, paragraphs 7-12).

For **claim 19**, Morris, as modified by Kusaka, discloses the image sensor according to claim 18, wherein said calibrating circuit comprises a constant current source selectively connected to each respective pixel (Kusaka p. 3, paragraph 60; fig. 3).

Claims 28-29 are claims corresponding to the claims 18-19, respectively. Therefore, claims 28-29 are analyzed and rejected as previously discussed with respect to claims 18-19, respectively.

Claims 34-35 are claims corresponding to the claims 18-19, respectively. Therefore, claims 34-35 are analyzed and rejected as previously discussed with respect to claims 18-19, respectively.

10. **Claims 20, 30, and 36** are rejected under 35 U.S.C. 103(a) as being unpatentable over Morris et al. (U.S. Pat. 6,697,112) in view of Kusaka et al. (US 2005/0052557) as applied to claims 19, 29, and 35 above, and further in view of He et al. (US Pat. 6,355,965).

For **claim 20**, Morris, as modified by Kusaka (fig. 3) discloses the image sensor according to claim 19, wherein an output node (Kusaka fig. 3, the node between T1 and T2) is associated with each photodiode, and wherein the linear and logarithmic output signals are derived from the output node (Kusaka, p. 3-4, paragraphs 63-64). However, Morris, as modified by Kusaka, do not expressly disclose said calibration circuit further comprising a switch

connected between said photodiode and the output node for isolating said photodiode from the output node while calibration takes place.

In a similar field of endeavor, He discloses a calibration circuit comprising a switch (fig. 4, S2) connected between said photodiode and the output node for isolating said photodiode from the output node while calibration takes place (col. 4, lines4-23). In light of the teaching of He, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the image sensor of Morris, as modified by Kusaka, with a switch as claimed in claim 20 in order to change to calibration mode (He, col. 4, lines4-23).

Both of **claims 30 and 36** are claims corresponding to the claim 20. Therefore, claims 30 and 36 are each analyzed and rejected as previously discussed with respect to claim 20.

Conclusion

11. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Watanabe (US 2006/0044436)

A control part executes control to alternately repeat a logarithmic operation period and a linear operation period.
